

Sustainability Now!

Sustainability Concepts and Frameworks

Lecture 01

Bruce D. Marron

September 6, 2026

Sustainability? Resilience?

Sustainability is a set of concepts and frameworks translated to direct human behaviors (decisions and management actions) that are applied across multiple, interlinked complex adaptive systems (CAS)

Traditional (reductionist) science is not so helpful when managing the behavior of complex adaptive systems

"The whole is greater than the sum of the parts"

Resilience

Resilience is the use of dynamic human imagination to adapt, transform, evolve, innovate, self-organize, restructure, and survive when confronted with identity-level disruptive change from turbulence, emergence, collapse, devastation, or crisis

Resilience pathways may lead to adaptation (The Ship of Theseus) or transformation (Death of the Gold Standard)

Resilience pathways may lead to dead ends

"Sometimes you need to break the resilience of the current system to enable shifts away from the current pathway(s) into new ones, into alternative basins of attraction"
